Breathe freely - professional steaming of hay bales

- Steaming of hay bales for feeding horses
- Support therapy for respiratory diseases
- Capacity from 5 to 90 horses/day

With the **Hay Steaming Set HDS 2530**, round bales with a diameter of up to 1.9 meters and square bales up to 2.5 meters can be reliably steamed.

This makes it possible for the first time to permanently supply larger stocks. The powerful system requires a cycle time of 2 to 5 hours for a round bale, depending on the diameter.

For this purpose, the proven Gebhardt steam generators have been specially developed for use in hay steaming.

The Hay Steamer HD16 has sufficient power to steam large bales of hay reliably and quickly.

In terms of safety, it is designed for installation and continuous operation in agricultural operations and is ready for use within 1 to 2 minutes.

Direct drinking water connection, 400 V connection (32 A CEE-plug), complete stainless-steel design and switchable frost protection device ensure problem-free continuous operation and guarantee reliable steaming.

With the help of the built-in timer and the three-stage power preselection, the desired process duration and the required amount of energy can be set precisely.

The **HDS 2530 complete set** for professional steaming includes the following components:

- Hay Steamer HD 16
- Pressure-tight steel container HDC 2530 with steel floor
- Stainless steel hay bale holder
- High quality food grade steam
- Food-grade steam hoses for the entire system
- Specially developed stainless steel steam lance
